

Local Run & Verification — Amend / Fix / Validate

Verification report — NIT-5141

Ticket	NIT-5141 — Run output locally and verify amending/fixing/validation
Author	Thong Ho (QC)
Date	2026-07-13
Environment	Local dev machine (Windows), Playwright / Chromium
Status	Verified

1. Objective

Confirm the automation output runs locally on the developer machine, and that the amend → fix → validate loop works: a test can be changed, a failure captured as evidence, the code fixed, and the result re-validated — with the defect correctly reflected in Jira.

2. How it is run (locally)

```
npm run test:saucedemo -- --headed    # run E2E, browser visible
npm run test:saucedemo:demo           # slow-motion run for review
npx playwright show-report             # open the HTML report
```

Runs entirely on the local machine; no Cowork required. The bug → Jira reporter runs automatically after the tests.

3. Test run result

Total	Passed	Failed
39	38	1

38 of 39 passed; 1 intentional failure was used to exercise the defect flow. Full detail available in the Playwright HTML report.

4. Amend → Fix → Validate cycle (demonstrated)

1. Amend — intentionally changed one test (TC_NAV_002) so it fails.
2. Observe — the test fails locally and the failure is captured as evidence (see Section 5).
3. Fix — corrected the test so it passes (reload before the assertion).
4. Validate — re-ran locally; the test passes and behaves as expected.
5. Reverse check — toggled the test back to failing to confirm the defect re-opens correctly.

5. Evidence captured on failure

- **bug-report** — a report with the ticket description (title, issue, steps, actual/expected, screenshot).
- **bug-image** — screenshot of the issue.
- **bug-video** — video of the failing run.

- **Jira** — defect auto-created under the Epic set in .env; status auto-updates to Done on pass; no duplicate is created on re-run while the defect persists.

6. Verification checklist

Check	Result
Tests run locally and produce an HTML report	✓ Pass
A failure produces bug-report + image + video	✓ Pass
A test can be amended and re-run locally	✓ Pass
A failing test, once fixed, passes on re-validation	✓ Pass
Defect auto-created in Jira on failure	✓ Pass
No duplicate ticket on re-run while the defect persists	✓ Pass
Ticket status auto-updates to Done on pass	✓ Pass
Ticket re-opens when the test fails again	✓ Pass

7. Notes

- The Jira steps require a valid HUB24 Jira token and network access to Atlassian (covered in the QC Automation Plan).
- Attach: terminal screenshot of the result, the HTML report, and the Jira ticket, as run evidence.
